# Introduction

This document provides SSH configuration examples.

## Prerequisites

The configuration examples in this document were created and verified in a lab environment, and all the devices were started with the factory default configuration. When you are working on a live network, make sure you understand the potential impact of every command on your network.

This document assumes that you have basic knowledge of SSH.

## General restrictions and guidelines

The devices in the configuration examples operate in non-FIPS mode.

When you configure SSH on a device that operates in FIPS mode, follow these restrictions and guidelines:

- The modulus length of the key pair must be 2048 bits.
- When the device acts as an SSH server, only RSA key pairs are supported. Do not generate a DSA key pair on the SSH server.

## Example: Configuring the device as an Stelnet server using password authentication

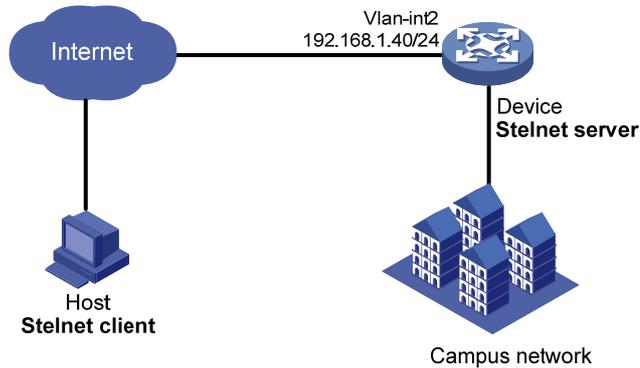

### Network configuration

As shown in [Figure 1](#):

- The device uses local password authentication.
- The login username and password are **client001** and **aabbcc**, respectively.

Establish an Stelnet connection between the host and the device, so you can log in to the device to manage the campus network.

Figure 1 Network diagram

## Analysis

To meet the network requirements, you must perform the following tasks:

- To ensure correct SSH version negotiation and algorithm negotiation, and to ensure that the server can pass the client's authentication, generate DSA and RSA key pairs on the server.
- To perform local authentication, create a local user and configure a password for the local user on the Stelnet server.
- To enable an SSH user to use all commands after login, set the user role of the local user to network-admin. By default, the user role of a local user is network-operator.
- The authentication mode for Stelnet user lines must be AAA (**scheme**).

## Applicable hardware and software versions

The following matrix shows the hardware and software versions to which this configuration example is applicable:

Hardware	Software version
S6850 switch series S9850 switch series	Release 6555P01
S9820-64H switch	Release 6555P01

## Procedures

# Generate RSA key pairs.

```
<Device> system-view
```

```
[Device] public-key local create rsa
```

The range of public key modulus is (512 ~ 4096).

If the key modulus is greater than 512, it will take a few minutes.

Press CTRL+C to abort.

```
Input the modulus length [default = 1024]:
```

```
Generating Keys...
```

```
..
```

Create the key pair successfully.

### # Generate a DSA key pair.

```
[Device] public-key local create dsa
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
.....
Create the key pair successfully.
```

### # Generate an ECDSA key pair.

```
[Device] public-key local create ecdsa secp256r1
Generating Keys...
.
Create the key pair successfully.
```

### # Enable the SSH server function.

```
[Device] ssh server enable
```

### # Create VLAN 2, and assign HundredGigE 1/0/2 to VLAN 2.

```
[Device] vlan 2
[Device-vlan2] port hundredgige 1/0/2
[Device-vlan2] quit
```

### # Assign an IP address to VLAN-interface 2. The Stelnet client uses the IP address as the destination address of the Stelnet connection.

```
[Device] interface vlan-interface 2
[Device-Vlan-interface2] ip address 192.168.1.40 255.255.255.0
[Device-Vlan-interface2] quit
```

### # Set the authentication mode to AAA (**scheme**) for the user lines.

```
[Device] line vty 0 63
[Device-line-vty0-63] authentication-mode scheme
[Device-line-vty0-63] quit
```

### # Create a local user **client001**.

```
[Device] local-user client001 class manage
New local user added.
```

### # Set the password to **aabbcc** in plain text for the local user **client001**.

```
[Device-luser-manage-client001] password simple aabbcc
```

### # Authorize the local user **client001** to use the **SSH** service.

```
[Device-luser-manage-client001] service-type ssh
```

### # Assign the user role **network-admin** to the local user **client001**.

```
[Device-luser-manage-client001] authorization-attribute user-role network-admin
[Device-luser-manage-client001] quit
```

## Verifying the configuration

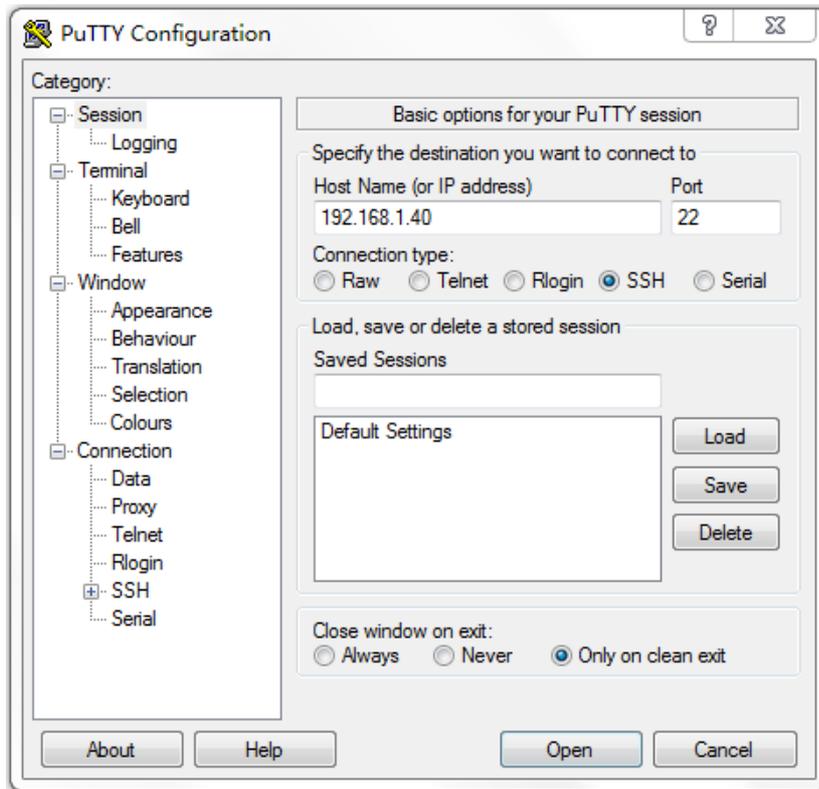

There are different types of Stelnet client software, such as PuTTY and OpenSSH. This example uses an Stelnet client that runs Putty version 0.60.

To verify that you can log in to the Stelnet server from the Stelnet client:

1. Launch PuTTY.exe.

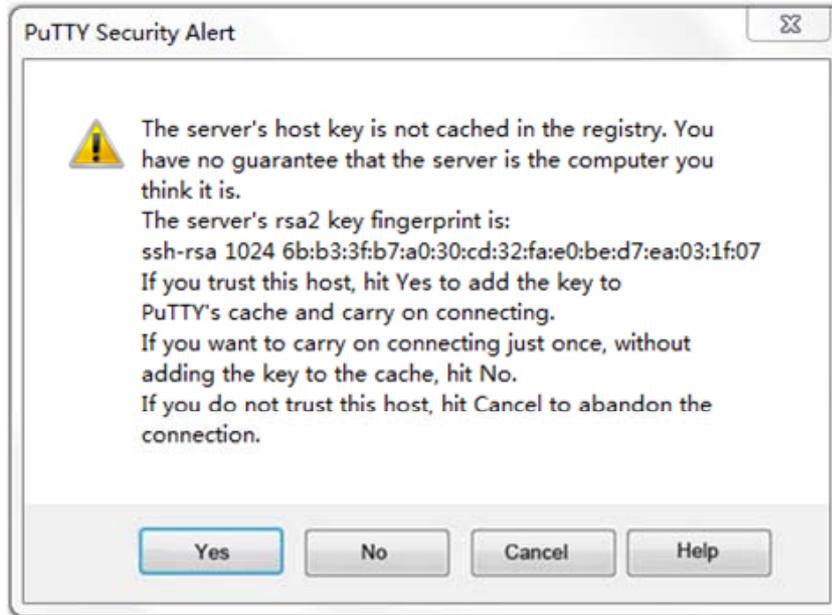

2. From the navigation tree, click **Session**.  
The interface shown in [Figure 2](#) appears.
3. In the **Specify the destination you want to connect to** area, configure the following parameters:
  - a. Enter **192.168.1.40** in the **Host Name (or IP address)** field.
  - b. Enter **22** in the **Port** field.
  - c. Select **SSH** for **Connection type**.

**Figure 2 Specifying basic connection parameters**

4. Click **Open**.  
The **PuTTY Security Alert** dialogue box appears.

Figure 3 PuTTY Security Alert dialogue box

5. Click **Yes**.
6. Enter the username **client001** and the password **aabbcc** to log in to the Stelnet server.

```
login as: client001
```

```
client001@192.168.1.40's password:
```

```
*****  
*Copyright (c) 2004-2019 New H3C Technologies Co., Ltd. All rights reserved.*  
* Without the owner's prior written consent, *  
* no decompiling or reverse-engineering shall be allowed. *  
*****
```

```
<Device>
```

## Configuration files

```
#  
vlan 2  
#  
interface Vlan-interface2  
 ip address 192.168.1.40 255.255.255.0  
#  
interface HundredGigE1/0/2  
 port link-mode bridge  
 port access vlan 2  
#  
 line vty 0 63  
 authentication-mode scheme  
#  
ssh server enable
```

```

#
local-user client001 class manage
  password hash $h$6$CqMnWdX6LIW/hz2Z$4+0Pumk+A98VlGVgqN3n/mEi7hJka9fEZpRZIpSNi9b
cBEXhpbvIqaYTvIVBf7ZUNGNovFsQW7nYxjoToRDvYBg==
  service-type ssh
  authorization-attribute user-role network-admin
  authorization-attribute user-role network-operator
#

```

# Example: Configuring the device as an Stelnet server using publickey authentication

## Network configuration

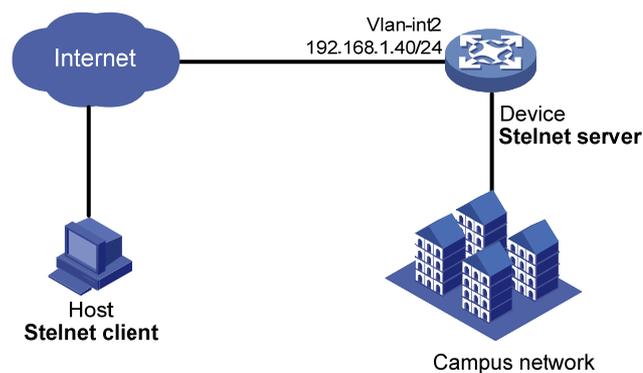

As shown in [Figure 4](#):

- The device uses publickey authentication and RSA public key algorithm.
- The login username is **client001**.

Establish an Stelnet connection between the host and the device, so you can log in to the device to manage the campus network.

Import the client's host public key to the server to ensure correct format and content of the public key.

**Figure 4 Network diagram**

## Analysis

To meet the network requirements, you must perform the following tasks:

- Because the client's host public key is required in the server configuration, you must generate RSA key pairs on the client before configuring the server.
- For successful publickey authentication, perform the following tasks:
  - a. Configure the client's RSA host public key on the server.
  - b. Specify the paired RSA host private key for the SSH user on the client.
- The authentication mode for Stelnet user lines must be AAA (**scheme**).

- To assign correct working directory and user role to the SSH user, you must create a local user on the Stelnet server. The local user must have the same username as the SSH user. To enable an SSH user to use all commands after login, set the user role of the local user to network-admin. By default, the user role of a local user is network-operator.

## Applicable hardware and software versions

The following matrix shows the hardware and software versions to which this configuration example is applicable:

Hardware	Software version
S6850 switch series S9850 switch series	Release 6555P01
S9820-64H switch	Release 6555P01

## Restrictions and guidelines

When you configure the device as an Stelnet server using publickey authentication, follow these restrictions and guidelines:

- In FIPS mode, the Stelnet server does not support publickey authentication.
- To support Stelnet clients that use different types of key pairs, generate DSA and RSA key pairs on the Stelnet server.

## Procedures

### Configuring the host as an Stelnet client

There are different types of Stelnet client software, such as PuTTY and OpenSSH. This example uses an Stelnet client that runs Putty version 0.60.

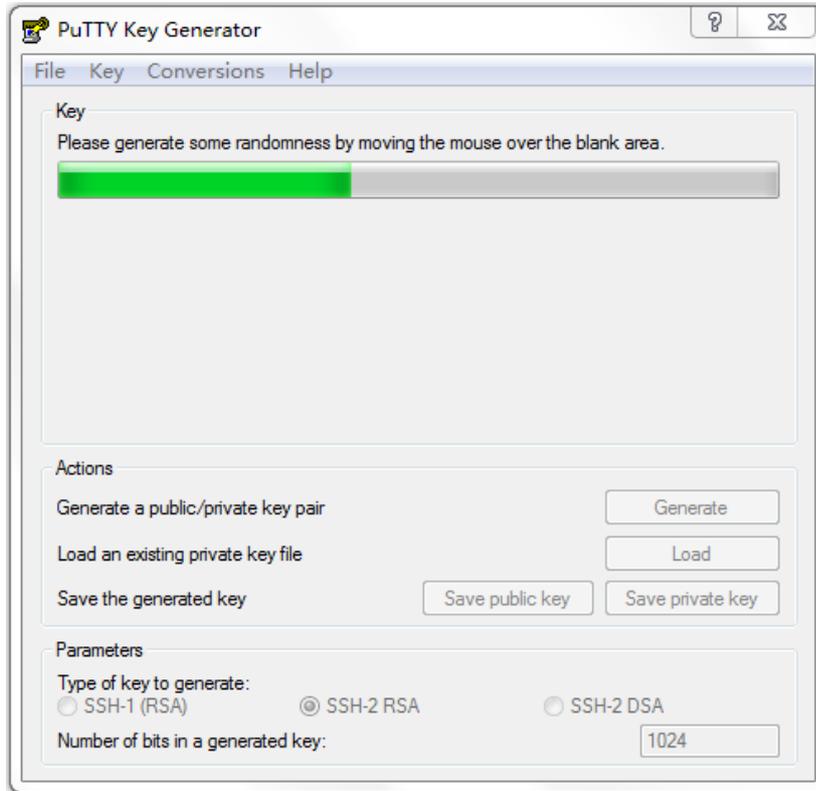

1. Run PuTTYGen.exe, select **SSH-2 RSA**, and click **Generate**.

**Figure 5 Generating a key pair on the client**

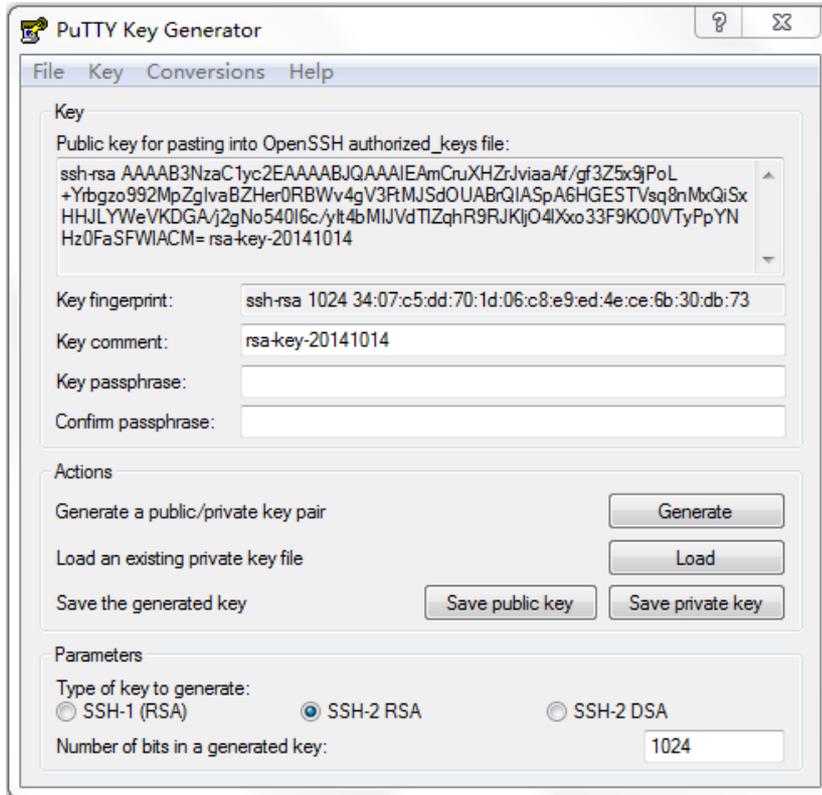

2. Continuously move the mouse and do not place the mouse over the green process bar shown in [Figure 6](#). Otherwise, the process bar stops moving and the key pair generating process stops.

**Figure 6 Generating process**

3. After the key pair is generated, click **Save public key**.  
A file saving window appears.
4. Select the saving directory (disk D in this example), enter a file name (**key.pub** in this example), and click **Save**.

**Figure 7 Saving a key pair on the client**

5. On the page shown in [Figure 7](#), click **Save private key**.  
A confirmation dialog box appears.
6. Click **Yes**.  
A file saving window appears.
7. Select the saving directory (disk D in this example), enter a file name (**private.ppk** in this example), and click **Save**.

## Configuring the device as the FTP server

# Create VLAN 2, and assign HundredGigE 1/0/2 to VLAN 2.

```
<Device> system-view
[Device] vlan 2
[Device-vlan2] port hundredgige 1/0/2
[Device-vlan2] quit
```

# Assign an IP address to VLAN-interface 2.

```
[Device] interface vlan-interface 2
[Device-Vlan-interface2] ip address 192.168.1.40 255.255.255.0
[Device-Vlan-interface2] quit
```

# Create a local user ftp.

```
[Device] local-user ftp class manage
New local user added.
```

# Set the password to ftp in plain text for the local user ftp.

```
[Device-luser-manage-ftp] password simple ftp
```

```

# Assign the user role network-admin to the local user ftp.
[Device-luser-manage-ftp] authorization-attribute user-role network-admin

# Assign the working directory flash:/ to the local user ftp.
[Device-luser-manage-ftp] authorization-attribute work-directory flash:/

# Authorize the local user ftp to use the FTP service.
[Device-luser-manage-ftp] service-type ftp
[Device-luser-manage-ftp] quit

# Enable the FTP server function.
[Device] ftp server enable
[Device] quit

```

## Uploading the public key file from the FTP client

```

# Log in to the FTP server from the host and upload the public key file key.pub to the server.
<Host>ftp 192.168.1.40
Press CTRL+C to abort.
Connected to 192.168.1.40 (192.168.1.40).
220 FTP service ready.
User (192.168.1.56:(none)): ftp
331 Password required for ftp.
Password:
230 User logged in.
Remote system type is UNIX.
Using binary mode to transfer files.
ftp> put flash:/key.pub
227 Entering Passive Mode (192,168,1,40,41,116)
150 Accepted data connection
226 File successfully transferred
301 bytes sent in 0.000 seconds (1.05 Mbytes/s)
ftp> quit
221-Goodbye. You uploaded 1 and downloaded 0 kbytes.
221 Logout.

```

## Configuring the device as the Stelnet server

```

# Generate RSA key pairs.
[Device] public-key local create rsa
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
...
Create the key pair successfully.

# Generate a DSA key pair.
[Device] public-key local create dsa
The range of public key modulus is (512 ~ 2048).

```

```

If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
...
Create the key pair successfully.
# Generate an ECDSA key pair.
[Device] public-key local create ecdsa secp256r1
Generating Keys...
.
Create the key pair successfully.
# Enable the SSH server function.
[Device] ssh server enable
# Set the authentication mode to AAA (scheme) for the user lines.
[Device] line vty 0 63
[Device-line-vty0-63] authentication-mode scheme
[Device-line-vty0-63] quit
# Import the client's public key from the file key.pub, and name the public key devicekey.
[Device] public-key peer devicekey import sshkey key.pub
# Create an SSH user client001. Specify the authentication type as publickey for the user, and
assign the public key devicekey to the user.
[Device] ssh user client001 service-type stelnet authentication-type publickey assign
publickey devicekey
# Create a local user client001.
[Device] local-user client001 class manage
New local user added.
# Authorize the local user client001 to use the SSH service.
[Device-luser-manage-client001] service-type ssh
# Assign the user role network-admin to the local user client001.
[Device-luser-manage-client001] authorization-attribute user-role network-admin
[Device-luser-manage-client001] quit

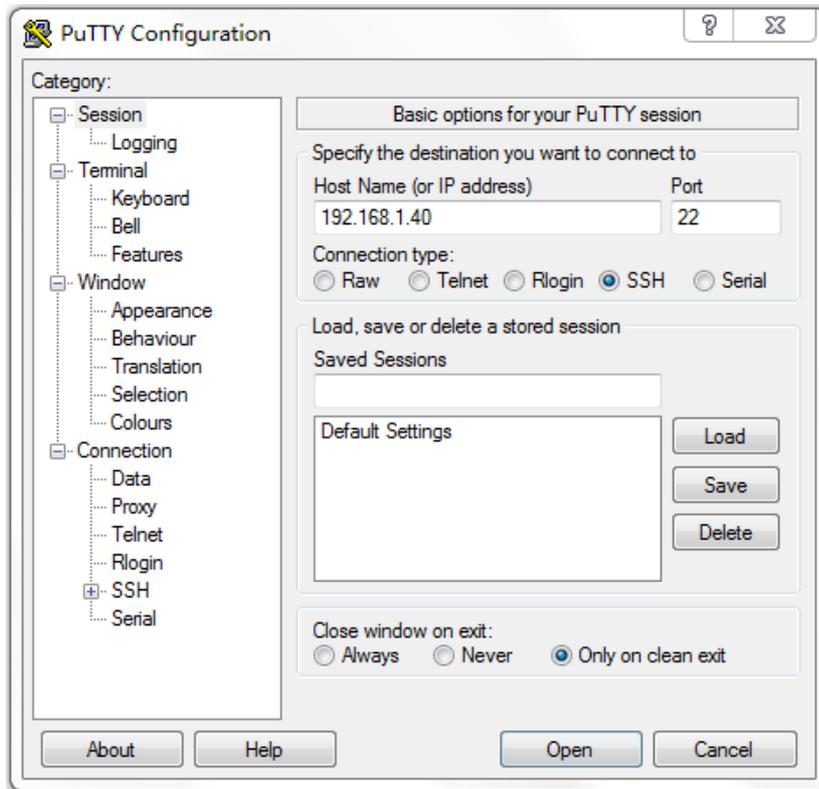

```

## Verifying the configuration

To verify that you can log in to the Stelnet server from the Stelnet client:

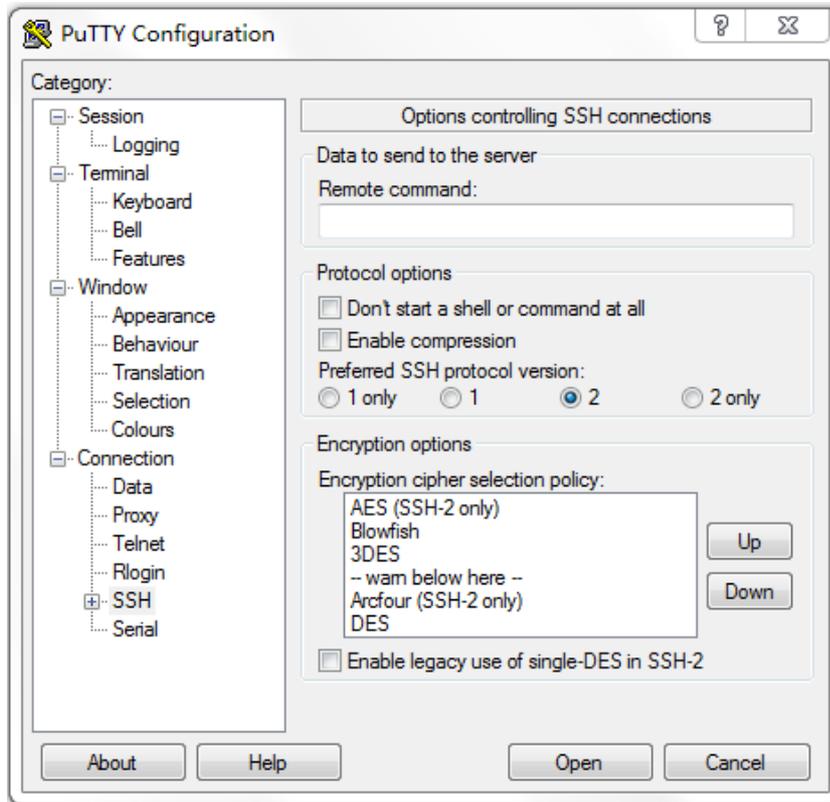

1. Launch PuTTY.exe.
2. From the navigation tree, click **Session**.  
The interface shown in [Figure 8](#) appears.
3. In the **Specify the destination you want to connect to** area, configure the following parameters:
  - a. Enter **192.168.1.40** in the **Host Name (or IP address)** field.
  - b. Enter **22** in the **Port** field.
  - c. Select **SSH** for **Connection type**.

**Figure 8 Specifying basic connection parameters**

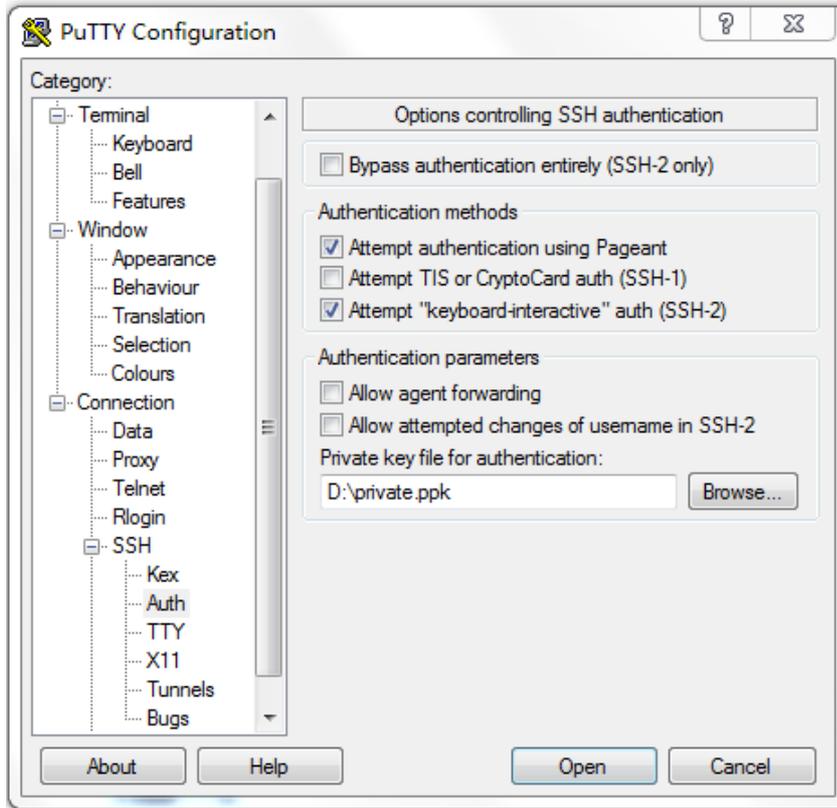

4. From the navigation tree, select **Connection > SSH**.  
The window shown in [Figure 10](#) appears.
5. In the **Protocol options** area, specify the preferred SSH version as 2.

**Figure 9 Specifying the SSH version**

6. From the navigation tree, select **Connection > SSH > Auth**.  
The window shown in [Figure 10](#) appears.
7. Click **Browse....**  
A file selection window appears.
8. Select the private key file **private.ppk**, and click **OK**.

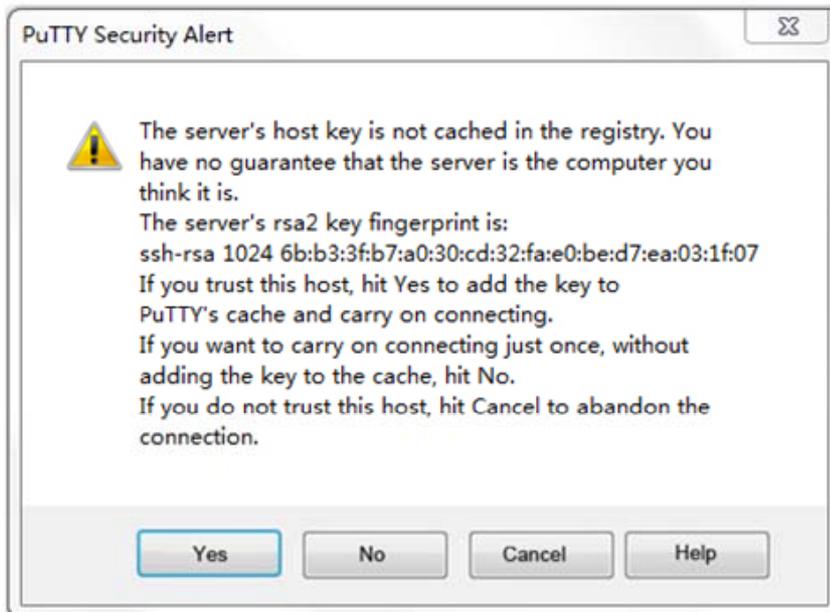

**Figure 10 Specifying the private key file**

9. Click **Open**.

The **PuTTY Security Alert** dialogue box appears.

**Figure 11 PuTTY Security Alert dialogue box**

10. Click **Yes**.

11. Enter the username **client001** to log in to the Stelnet server.

login as: client001

Authenticating with public key "rsa-key-20140726"

# Example: Configuring the device as an Stelnet client for password authentication

## Network configuration

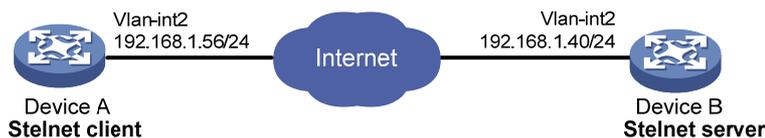

As shown in [Figure 12](#):

- Device B uses local password authentication.
- The login username and password are **client001** and **aabbcc**, respectively.

Establish an Stelnet connection between Device A and Device B, so you can log in to Device B to use all commands and perform secure data exchange.

To ensure communication security, configure Device A to use the host public key of Device B to authenticate Device B.

**Figure 12 Network diagram**

## Analysis

To meet the network requirements, you must perform the following tasks:

- To ensure correct SSH version negotiation and algorithm negotiation, and to ensure that the server can pass the client's authentication, generate DSA and RSA key pairs on the server.
- The authentication mode for Stelnet user lines must be AAA (**scheme**).
- To perform local authentication, create a local user and configure a password for the local user on the Stelnet server.
- To enable an SSH user to use all commands after login, set the user role of the local user to network-admin. By default, the user role of a local user is network-operator.
- Because the Stelnet client uses the host public key of the server to authenticate the server, you must configure the host public key of the server on the client.

## Applicable hardware and software versions

The following matrix shows the hardware and software versions to which this configuration example is applicable:

Hardware	Software version
S6850 switch series S9850 switch series	Release 6555P01
S9820-64H switch	Release 6555P01

# Procedures

## Configuring the Stelnet server

**# Generate RSA key pairs.**

```
<DeviceB> system-view
[DeviceB] public-key local create rsa
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
...
Create the key pair successfully.
```

**# Generate a DSA key pair.**

```
[DeviceB] public-key local create dsa
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
...
Create the key pair successfully.
```

**# Generate an ECDSA key pair.**

```
[DeviceB] public-key local create ecdsa secp256r1
Generating Keys...
.
Create the key pair successfully.
```

**# Enable the SSH server function.**

```
[DeviceB] ssh server enable
```

**# Create VLAN 2, and assign HundredGigE 1/0/2 to VLAN 2.**

```
[DeviceB] vlan 2
[DeviceB-vlan2] port hundredgige 1/0/2
[DeviceB-vlan2] quit
```

**# Assign an IP address to VLAN-interface 2. The Stelnet client uses this address as the destination address of the Stelnet connection.**

```
[DeviceB] interface vlan-interface 2
[DeviceB-Vlan-interface2] ip address 192.168.1.40 255.255.255.0
[DeviceB-Vlan-interface2] quit
```

**# Set the authentication mode to AAA (**scheme**) for the user lines.**

```
[DeviceB] line vty 0 63
[DeviceB-line-vty0-63] authentication-mode scheme
[DeviceB-line-vty0-63] quit
```

**# Create a local user **client001**.**

```
[DeviceB]local-user client001 class manage
New local user added.
```

```

# Set the password to aabbcc in plain text for the local user client001.
[DeviceB-luser-manage-client001] password simple aabbcc

# Authorize the local user client001 to use the SSH service.

```

# Exit public key view.

```
[DeviceA-pkey-public-key-key1] peer-public-key end
[DeviceA] return
```

## Verifying the configuration

# Verify that you can log in to the Stelnet server from the Stelnet client. The host public key of the server is **key1**.

```
<DeviceA> ssh2 192.168.1.40 publickey key1
login as: client001
client001@192.168.1.40's password:
```

```
*****
*Copyright (c) 2004-2019 New H3C Technologies Co., Ltd. All rights reserved.*
* Without the owner's prior written consent, *
* no decompiling or reverse-engineering shall be allowed. *
*****
```

```
<DeviceB>
```

After you enter the username (**client001**) and the password (**aabbcc**), you can log in to the Stelnet server successfully.

## Example: Configuring SFTP with password-publickey authentication

### Network configuration

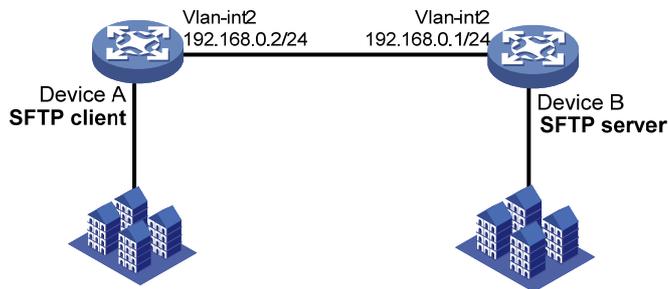

As shown in [Figure 13](#):

- Device B uses password-publickey authentication and RSA public key algorithm.
- The login username and password are **client001** and **aabbcc**, respectively.

Establish an SFTP connection between Device A and Device B, so you can log in to Device B to perform file and directory operations.

Import the client's host public key to the server to ensure correct format and content of the public key.

**Figure 13 Network diagram**

## Analysis

To meet the network requirements, you must perform the following tasks:

- Because the client's host public key is required in the server configuration, you must generate RSA key pairs on the client before configuring the SFTP server.
- For successful publickey authentication, perform the following tasks:
  - a. Configure the client's RSA host public key on the server.
  - b. Specify the paired RSA host private key for the SSH user on the client.  
To specify the RSA host private key on the client, use the `identity-key rsa` keyword in the `sftp` command.
- To perform local authentication, create a local user and configure a password for the local user on the SFTP server.
- To enable an SSH user to use all commands after login, set the user role of the local user to `network-admin`. By default, the user role of a local user is `network-operator`.
- To assign correct working directory and user role to the SSH user, configure the local user to have the same username as the SSH user.

## Applicable hardware and software versions

The following matrix shows the hardware and software versions to which this configuration example is applicable:

Hardware	Software version
S6850 switch series S9850 switch series	Release 6555P01
S9820-64H switch	Release 6555P01

## Restrictions and guidelines

When you configure SFTP with password-publickey authentication, follow these restrictions and guidelines:

- In FIPS mode, the SFTP server does not support publickey authentication.
- To support SFTP clients that use different types of key pairs, generate DSA and RSA key pairs on the SFTP server.

## Procedures

### Configuring Device A as the SFTP client

# Create VLAN 2, and assign HundredGigE 1/0/2 to VLAN 2.

```
<DeviceA> system-view
[DeviceA] vlan 2
[DeviceA-vlan2] port hundredgige 1/0/2
[DeviceA-vlan2] quit
```

# Assign an IP address to VLAN-interface 2. The client uses this address to connect to the server.

```
[DeviceA] interface vlan-interface 2
[DeviceA-Vlan-interface2] ip address 192.168.0.2 255.255.255.0
[DeviceA-Vlan-interface2] quit
```

# Generate RSA key pairs.

```
[DeviceA] public-key local create rsa
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
...
Create the key pair successfully.
```

# Export the host public key to the file **key.pub**.

```
[DeviceA] public-key local export rsa ssh2 key.pub
[DeviceA] quit
```

### Configuring Device B as the FTP server

# Create VLAN 2, and assign HundredGigE 1/0/2 to VLAN 2.

```
<DeviceB> system-view
[DeviceB] vlan 2
[DeviceB-vlan2] port hundredgige 1/0/2
[DeviceB-vlan2] quit
```

# Assign an IP address to VLAN-interface 2.

```
[DeviceB] interface vlan-interface 2
[DeviceB-Vlan-interface2] ip address 192.168.0.1 255.255.255.0
[DeviceB-Vlan-interface2] quit
```

# Create a local user **ftp**.

```
[DeviceB] local-user ftp class manage
New local user added.
```

# Set the password to **ftp** in plain text for the local user **ftp**.

```
[DeviceB-luser-manage-ftp] password simple ftp
```

```

# Assign the user role network-admin to the local user ftp.
[DeviceB-luser-manage-ftp] authorization-attribute user-role network-admin

# Assign the working directory flash:/ to the local user ftp.
[DeviceB-luser-manage-ftp] authorization-attribute work-directory flash:/

# Authorize the local user ftp to use the FTP service.
[DeviceB-luser-manage-ftp] service-type ftp
[DeviceB-luser-manage-ftp] quit

# Enable the FTP server function.
[DeviceB] ftp server enable
[DeviceB] quit

```

## Uploading the public key file from the FTP client

```

# Log in to the FTP server from Device A and upload the public key file key.pub to the server.
<DeviceA>ftp 192.168.0.1
Press CTRL+C to abort.
Connected to 192.168.0.1 (192.168.0.1).
220 FTP service ready.
User (192.168.0.2:(none)): ftp
331 Password required for ftp.
Password:
230 User logged in.

```

## Configuring Device B as the SFTP server

```

# Generate RSA key pairs.
<DeviceB> system-view
[DeviceB] public-key local create rsa
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
...
Create the key pair successfully.

# Generate a DSA key pair.
[DeviceB] public-key local create dsa

```

```

The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
...
Create the key pair successfully.
# Generate an ECDSA key pair.
[DeviceB] public-key local create ecdsa secp256r1
Generating Keys...
.
Create the key pair successfully.
# Enable the SFTP server function.
[DeviceB] sftp server enable
# Import the client's public key from the file key.pub, and name the public key devicekey.
[DeviceB] public-key peer devicekey import sshkey key.pub
# Create an SSH user client001. Specify the authentication type as password-publickey for the
user, and assign the public key devicekey to the user.
[DeviceB] ssh user client001 service-type sftp authentication-type password-publickey
assign publickey devicekey
# Create a local user client001.
[DeviceB] local-user client001 class manage
New local user added.
# Set the password to aabbcc in plain text for the local user client001.
[DeviceB-luser-manage-client001] password simple aabbcc
# Authorize the local user client001 to use the SSH service.
[DeviceB-luser-manage-client001] service-type ssh
# Assign the user role network-admin and working directory flash:/ to the local user client001.
[DeviceB-luser-manage-client001] authorization-attribute user-role network-admin
work-directory flash:/
[DeviceB-luser-manage-client001] quit

```

## Verifying the configuration

1. Verify that you can log in to the SFTP server from the SFTP client.

```

<DeviceA >sftp 192.168.0.1 identity-key rsa
Username: client001
Press CTRL+C to abort.
Connecting to 192.168.0.1 port 22.
The server is not authenticated. Continue? [Y/N]:y
Do you want to save the server public key? [Y/N]:n
client001@192.168.0.1's password:
After you enter the password, you are placed in SFTP client view.
sftp>

```
2. Verify that you can perform file and directory operations after logging in to the SFTP server:

```

# Display files under the current directory of the server, delete the file z, and verify the result.

```

```
sftp> dir -l
-rwxrwxrwx  1 1      1          1759 Aug 23 06:52 config.cfg
-rw-rw----  1 1      1          301 Aug  7 16:52 key.pub
-rwxrwxrwx  1 1      1           0 Sep 01 06:22 new
-rwxrwxrwx  1 1      1          225 Sep 01 06:55 pub
-rwxrwxrwx  1 1      1          225 Aug 24 08:01 pubkey2
-rwxrwxrwx  1 1      1           0 Sep 01 08:00 z
```

```
sftp> delete z
```

```
Removing /z
```

```
sftp> dir -l
-rwxrwxrwx  1 1      1          1759 Aug 23 06:52 config.cfg
-rw-rw----  1 1      1          301 Aug  7 16:52 key.pub

# Example: Configuring SCP file transfer with remote password authentication

## Network configuration

As shown in [Figure 14](#), configure the devices and the RADIUS server to meet the following requirements:

- Establish an SCP connection between Device A and Device B, so you can log in to Device B to perform file transfer.
- Use the RADIUS server for SSH user authentication and authorization. The user name and password are **hello@bbb** and **aabbcc**, respectively.
- Include the domain name in the username sent to the RADIUS server.
- Assign the default user role **network-admin** to the SSH user, so the user can use all commands after login.

**Figure 14 Network diagram**

## Analysis

To meet the network requirements, you must perform the following tasks:

- To ensure correct SSH version negotiation and algorithm negotiation, and to ensure that the server can pass the client's authentication, generate DSA and RSA key pairs on the SSH server.
- To perform remote password authentication, configure the username and password on the RADIUS server. To enable an SSH user to use all commands after login, set the user role to **network-admin** for the user on the RADIUS server.

- To use the RADIUS server for authentication and authorization, perform the following tasks on Device B:
  - a. Configure a RADIUS scheme to specify the authentication and authorization server.
  - b. Create an ISP domain, and specify the ISP domain to use the RADIUS scheme for authentication, authorization, and accounting.
- To ensure communication security between the RADIUS client (Device B) and the RADIUS server, configure the same shared key on Device B and the RADIUS server.

## Applicable hardware and software versions

The following matrix shows the hardware and software versions to which this configuration example is applicable:

Hardware	Software version
S6850 switch series S9850 switch series	Release 6555P01
S9820-64H switch	Release 6555P01

## Procedures

### Configuring the RADIUS server

In this example, the RADIUS server runs on IMC PLAT 7.0 (E0102) and IMC UAM 7.0 (E0201).

#### Adding Device B to the IMC Platform as an access device

1. Log in to IMC.
2. Click the **User** tab.
3. From the navigation tree, select **User Access Policy > Access Device Management > Access Device**.
4. Click **Add**.
5. Configure an access device as follows:
  - a. Set the ports for authentication and accounting to **1812** and **1813**, respectively.
  - b. Select the service type **Device Management Service**.
  - c. Select the access device type **HP(Comware)**.
  - d. Set the shared key to **expert** for secure RADIUS communication.
  - e. Select Device B from the device list or manually add Device B. (The IP address of Device B is 10.1.1.2).
  - f. Use the default settings for other parameters.
6. Click **OK**.

**Figure 15 Adding Device B as an access device**

### Adding an account for device management

1. Click the **User** tab.
2. From the navigation tree, select **Access User > Device User**.
3. Click **Add**.
4. Configure a device management account as follows:
  - a. Enter the account name **hello@bbb** and the password **aabbcc**.
  - b. Select the service type **SSH**.
  - c. Enter the user role **network-admin** in the **Role Name** field.
  - d. Specify **10.1.1.0** to **10.1.1.255** as the IP address range of the devices to be managed.
5. Click **OK**.

**Figure 16 Adding a device management account**

User > Device User > Add Device User Help

**Add Device User**

**Basic Information of Device User**

Account Name *	<input type="text" value="hello@bbb"/>	
User Password *	<input type="text" value="*****"/>	
Confirm Password *	<input type="text" value="*****"/>	
Service Type	<input type="text" value="SSH"/>	
EXEC Priority	<input type="text"/>	
Role Name	<input type="text" value="network-admin"/>	

**Tips**

Note: If you enter multiple role names, enter one role name on each line. The sum of the total number of bytes occupied by the role names and the number of role names (excluding duplicate names) cannot exceed 234. For example, if you enter 10 role names, the number of bytes occupied by the role names cannot exceed 224.

**Bound User IP List**

Start IP	End IP	Delete
No match found.		

**IP Address List of Managed Devices**

Start IP	End IP	Delete
10.1.1.0	10.1.1.255	<input type="button" value="Delete"/>

# Configuring Device B

## # Generate RSA key pairs.

```
<DeviceB> system-view
[DeviceB] public-key local create rsa
The range of public key modulus is (512 ~ 4096).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
...
Create the key pair successfully.
```

## # Generate a DSA key pair.

```
[DeviceB] public-key local create dsa
The range of public key modulus is (512 ~ 2048).
If the key modulus is greater than 512, it will take a few minutes.
Press CTRL+C to abort.
Input the modulus length [default = 1024]:
Generating Keys...
...
Create the key pair successfully.
```

## # Generate an ECDSA key pair.

```
[DeviceB] public-key local create ecdsa secp256r1
Generating Keys...
.
Create the key pair successfully.
```

## # Create VLAN 2, and assign HundredGigE 1/0/2 to VLAN 2.

```
[DeviceB] vlan 2
[DeviceB-vlan2] port hundredgige 1/0/2
[DeviceB-vlan2] quit
```

## # Assign an IP address to VLAN-interface 2. The SCP client uses this address as the destination IP address of the SCP connection.

```
[DeviceB] interface vlan-interface 2
[DeviceB-Vlan-interface2] ip address 192.168.0.1 255.255.255.0
[DeviceB-Vlan-interface2] quit
```

## # Create VLAN 3, and assign HundredGigE 1/0/3 to VLAN 3.

```
[DeviceB] vlan 3
[DeviceB-vlan3] port hundredgige 1/0/3
[DeviceB-vlan3] quit
```

## # Assign an IP address to VLAN-interface 3. Device B uses this address to communicate with the RADIUS server.

```
[DeviceB] interface vlan-interface 3
[DeviceB-Vlan-interface3] ip address 10.1.1.2 255.255.255.0
[DeviceB-Vlan-interface3] quit
```

## # Enable the SSH server function.

```
[DeviceB] ssh server enable
```

## # Create a RADIUS scheme **rad**.

```

[DeviceB] radius scheme rad

# Specify the primary authentication server 10.110.1.1 and UDP port 1812 for the RADIUS scheme
rad.
[DeviceB-radius-rad] primary authentication 10.1.1.1 1812

# Specify the primary authentication server 10.110.1.1 and UDP port 1813 for the RADIUS scheme
rad.
[DeviceB-radius-rad] primary accounting 10.1.1.1 1813

# Specify the shared key as expert for secure authentication and accounting communication.
[DeviceB-radius-rad] key authentication simple expert
[DeviceB-radius-rad] key accounting simple expert

# Include domain names in the usernames sent to the RADIUS server.
[DeviceB-radius-rad] user-name-format with-domain
[DeviceB-radius-rad] quit

# Create an ISP domain bbb.
[DeviceB] domain bbb

# Configure ISP domain bbb to use RADIUS scheme rad for authentication, authorization, and
accounting of all login users.
[DeviceB-isp-bbb] authentication login radius-scheme rad
[DeviceB-isp-bbb] authorization login radius-scheme rad
[DeviceB-isp-bbb] accounting login radius-scheme rad
[DeviceB-isp-bbb] quit

```

## Configuring Device A

```

# Create VLAN 2, and assign HundredGigE 1/0/2 to VLAN 2.
<DeviceA> system-view
[DeviceA] vlan 2
[DeviceA-vlan2] port hundredgige 1/0/2
[DeviceA-vlan2] quit

# Assign an IP address to VLAN-interface 2.
[DeviceA] interface vlan-interface 2
[DeviceA-Vlan-interface2] ip address 192.168.0.2 255.255.255.0
[DeviceA-Vlan-interface2] quit
[DeviceA] quit

```

## Verifying the configuration

```

# Verify that you can log in to the SCP server, download the file remote.bin from the server, and save
it locally with the name local.bin.
<DeviceA> scp 192.168.0.1 get remote.bin local.bin
Username: hello@bbb
Press CTRL+C to abort.
Connecting to 192.168.0.1 port 22.
The Server is not authenticated. Continue? [Y/N]:y
Do you want to save the server public key? [Y/N]:n
hello@bbb@192.168.0.1's password:
remote.bin                               100% 8275KB 318.3KB/s   00:26.

```

# Configuration files

- Device A:

```
#
vlan 2
#
interface Vlan-interface2
ip address 192.168.0.2 255.255.255.0
#
interface HundredGigE1/0/2
port link-mode bridge
port access vlan 2
#
```

- Device B:

```
#
vlan 2 to 3
#
interface Vlan-interface2
ip address 192.168.0.1 255.255.255.0
#
interface Vlan-interface3
ip address 10.1.1.2 255.255.255.0
#
interface HundredGigE1/0/2
port link-mode bridge
port access vlan 2
#
interface HundredGigE1/0/3
port link-mode bridge
port access vlan 3
#
